## INTRODUCTION

At the request of Bernardin-Lochmueller & Associates, Inc. (BLA) and the Indiana Department of Transportation (INDOT), researchers from Landmark Archaeological & Environmental Services, Inc. (Landmark) have conducted an archaeological records check and GIS-based archaeological analyses for the I-69, Evansville to Indianapolis, Indiana Tier 1 Environmental Impact Statement (EIS). The project area for this study includes five, 2-mile wide study bands (Figure 1) encompassing twelve alternatives (1, 2A, 2B, 2C, 3A, 3B, 3C, 4A, 4B, 4C, 5A, and 5B). These study bands traverse nineteen southwestern Indiana counties including; Clay, Daviess, Gibson, Greene, Hendricks, Johnson, Knox, Lawrence, Marion, Martin, Monroe, Morgan, Owen, Pike, Putnam, Sullivan, Vanderburgh, Vigo, and Warrick.

The purpose of this study was to provide a summary of the previously known archaeological sites located within the project area through the examination of state, regional and local sources in order to determine the effects the project might have on the archaeological resources of southwest Indiana. This information combined with the GIS-based archaeological analysis, was used to determine the potential for discovering additional archaeological sites within the study area and helped guide the choice of a final preferred alternate for the project.

Upon completion and approval of the Tier 1 EIS and the selection of a single alternative, this project will be divided into several segments of independent utility and Tier 2 EIS studies will be conducted. Archaeological investigations for each Tier 2 study will begin with an updated detailed archaeological records check; followed by a Phase Ia archaeological field reconnaissance to document previously unrecorded prehistoric and historic resources. Based upon the results of the archaeological records check and Phase Ia field reconnaissance further investigations may include Phase Ib intensive surveys to better define certain previously recorded or newly discovered archaeological sites, Phase Ic subsurface investigations to discover any buried archaeological resources, Phase II testing of potentially significant archaeological sites, and Phase III mitigation/data recovery of archaeological sites determined to be of National or State Registers significance and that cannot be avoided.

## CULTURAL BACKGROUND

Archaeology is the study of the material past left by man. Prehistoric archaeology is an attempt to interpret from these cultural materials how and where people lived, what was important to them, and what factors affected their daily lives when no written record exists. Historic archaeology is the study of the cultural materials of man enhanced by written records. The study of historic cultural materials provides insight to the richness of our human heritage that is often only touched upon in the written word. Although Euro-American peoples have been in Indiana for about 300 years, through archaeology we can trace our common Native and American history in this “place of Indians” at least 14,000 years and maybe much earlier. Because this record in the ground is so fragile and can easily be destroyed forever, environmental laws protecting cultural resources have been enacted requiring that we thoroughly search for

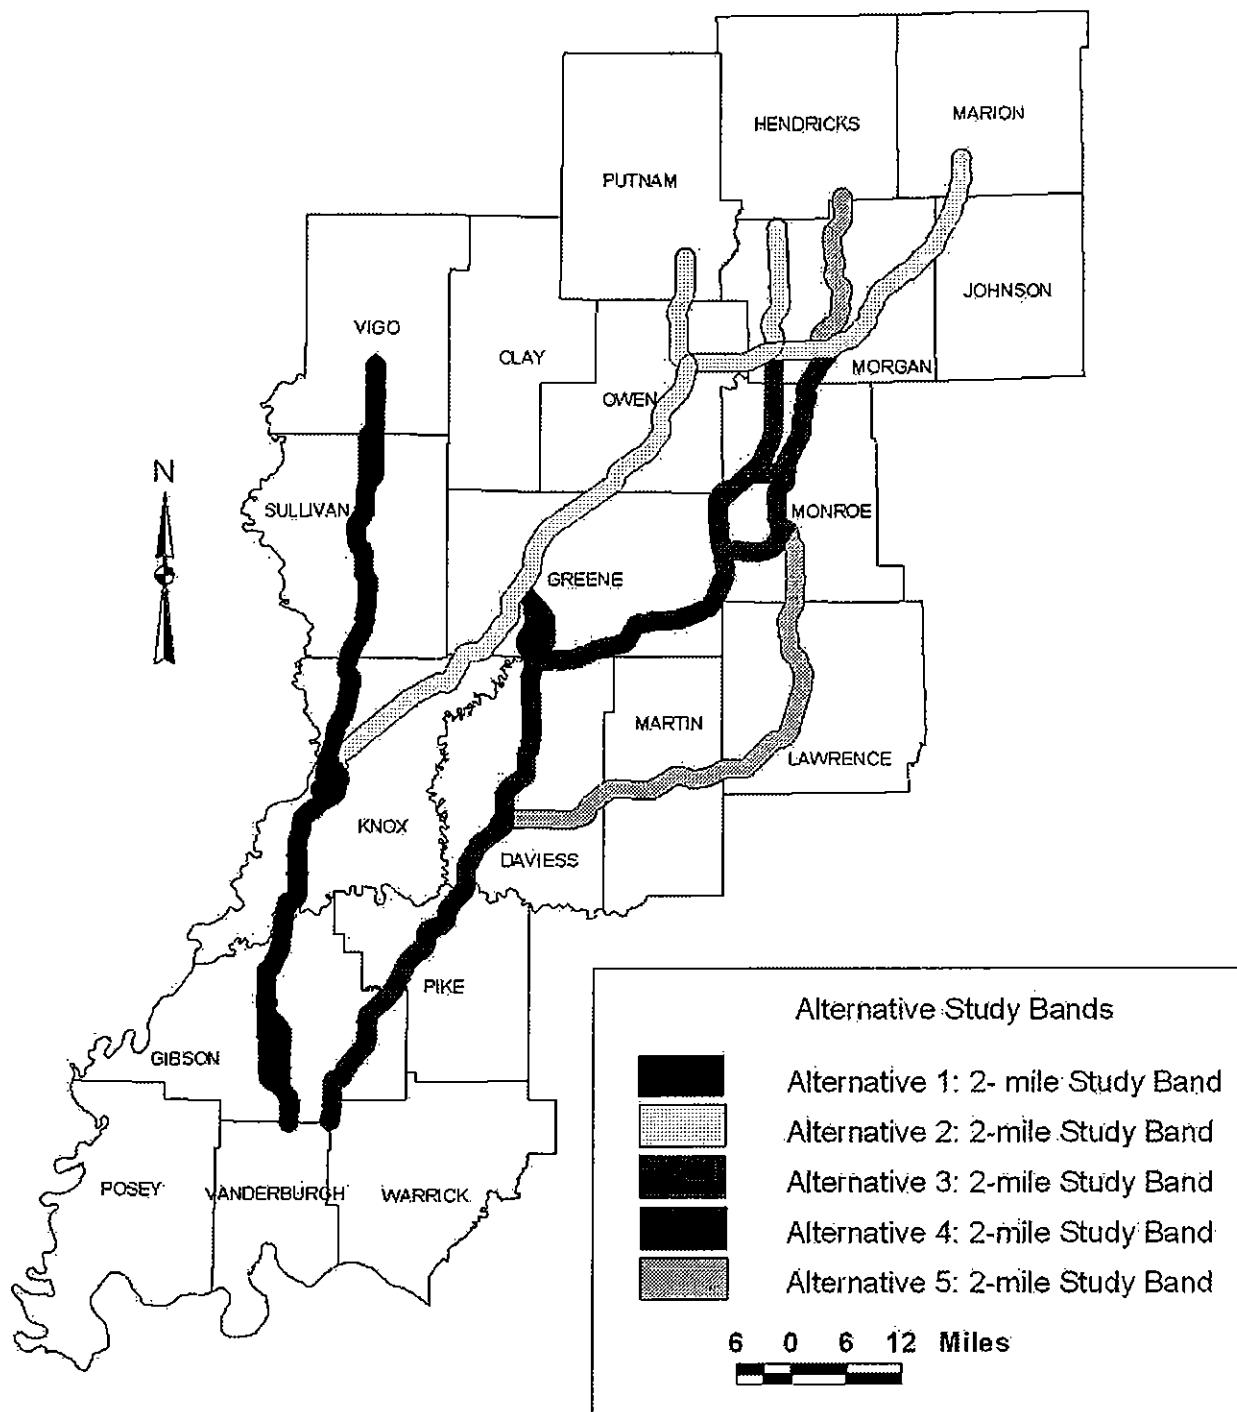

Figure 1. Alternative Study Areas

archaeological sites and consider the effect a proposed project will have to them. This study is an effort to satisfy these requirements in this I-69 Tier 1 EIS alternative selection process.

#### Paleo-Indian (prior to 8000 B.C.)

*General Background.* The evidence for Paleo-Indian peoples in eastern North America includes several types of lanceolate fluted and unfluted points as well as a diverse assemblage of chipped stone tools (Griffin 1967:176; Justice 1987). During late glacial and early post-glacial times these tools were probably used to exploit available large game such as caribou, musk oxen, mammoth, and mastodon as well as scarce edible plants. Small sites with no evidence for permanent structures and low artifact densities imply high mobility and band-level social organization (Stoltman and Baerreis 1983:253-254). During later Paleo-Indian times the subsistence base began to shift from a focus on large game towards broader based hunting and collecting. This trend was probably accompanied by greater territorial restriction and increasingly stable regional adaptations (Hicks 1992:13; Stoltman and Baerreis 1983:255).

Though many accept the makers of Clovis type fluted points (ca. 10,000 B.C.) as the first inhabitants of North America, the possibility remains that earlier Asian migrations may have resulted in population of parts of the continent. Geological evidence indicates that gradual migrations across Berengia and through an ice free corridor in North America could have occurred between 33,000 and 17,000 B.C. as well as between the more traditionally recognized interval of 12,000 – 10,000 B.C. Early migrants using boats may not have needed a land corridor to enter the continent throughout this time frame (Meltzer 1989:474). Despite a lack of totally convincing archaeological evidence for pre-Clovis occupations at this time, some may eventually be forthcoming.

*Local Patterns.* Over 400 fluted points have been found in Indiana, the majority in the southern half of the state from floodplain or terrace contexts. Tankersley (1992:8) notes that more than half of the known fluted points are found along the Ohio and Wabash Rivers where the state was not glaciated or near bedrock sources of high quality chert. The largest concentrations of fluted points are found on terraces and floodplains.

Small numbers of fluted points have been reported for most of the counties of southwestern Indiana (Tankersley 1992:9), with Daviess and Pike counties being notable exceptions since none have been reported. Later styles of Paleo-Indian points are reported to occur, also in small numbers, along the West Fork of the White River in southwestern Indiana (Tomak 1983:69).

#### Early Archaic (ca. 8000 - 6000 B.C.)

*General Background.* For some archaeologists, the distinction implied by the term Early Archaic is a blurred one, marking the time of transition from specialized large game hunting and limited foraging toward more regionally focused hunting of deer and small game (Stoltman 1978:714; Hicks 1992:13). Tool assemblages from the Midwest indicate continued emphasis on hunting and animal processing (Griffin 1983:244), though gathering of newly available plants and aquatic resources increased in importance during this time. In general, the subsistence base

probably became more diversified and involved more intensive exploitation of local resources (Stoltman and Baerreis 1983:255). A longer-term centralized base camp in a strategic location would have served as the center for numerous smaller hunting and gathering camps, resulting in an overall increase in the number of sites (Stoltman and Baerreis 1983:255). Diagnostics of the Early Archaic in the eastern United States include points of the Thebes, Large Side Notched, Kirk Corner Notched, Kirk Stemmed, Rice Lobed, and LeCroy clusters (Justice 1987:54-96).

*Local Patterns.* Early Archaic sites in southern Indiana have been found in the uplands and valleys as well as adjacent to lakes and wetlands. The Swan's Landing Site along the Ohio River in Harrison County is an example of a deeply buried Early Archaic site (Smith 1995). The site has produced fire-reddened soil lenses, charcoal concentrations, small artifact concentrations, and points from the Kirk Corner Notched Cluster. Smith infers that the site served primarily as a station for the reduction of locally obtained Wyandotte chert (1995:209).

Research in the Wabash Lowland of southwestern Indiana (Stafford 1994:219) suggests that Early Archaic settlement patterns may reflect a more mobile foraging strategy than described above. Habitation sites were detected in remote upland areas as well as along major rivers and streams (i.e., on terraces and floodplains). This pattern contrasts with the riverine focus of Middle and Late Archaic times. The Early Archaic habitation sites found by Stafford appeared short term, probably due to high residential mobility, low bulk resource procurement, and small dispersed populations.

Tomak (1983) has encountered a number of different point styles representing the Early Archaic during his research in the White River Valley of southwestern Indiana. They are compared here to more inclusive type clusters defined by Justice (1987), as is the case throughout this background section. Points that generally fit into the Thebes Cluster (Cache Diagonal Notched, St. Charles-like or Dovetail, Dover Hill), the Kirk Corner Notched Cluster (Charleston Corner Notched-like), the Kirk Stemmed Cluster (Kirk Serrated-like, Jessup), and the LeCroy Cluster (Frederick) are found in the area, but not frequently (Tomak 1983:69-70). Bynum points (Kirk Corner Notched Cluster) are well represented in Greene County. The Jerger Phase for the White River Valley has been formulated from the presence of bifurcated base Jerger points (Rice Lobed Cluster), most notably at the Jerger Site (Tomak 1983:70-71). This site is an Early Archaic cemetery in the West Fork of the White River Valley in Daviess County. Excavations at this site in the late 1970s revealed grave pits with cremated bone and grave offerings. Exotic marine shell was present, which suggests widespread interaction. It is suggested that this phase dates to approximately 7000-6000 B.C. (Tomak 1983:70-71). Tomak and this principal (1979) also conducted an archaeological reconnaissance for the construction of the US 50 Bypass in Knox and Daviess counties. Of the six Early Archaic sites encountered within the study corridor in Daviess County: four were situated in upland areas, one was on a terrace, and one on a slight rise near an old channel of the West Fork of the White River.

#### Middle Archaic (ca. 6000 - 4000 B.C.)

*General Background.* Middle Archaic people of the Midwest adapted to a time of maximum warmth and dryness that was accompanied by the spread of grasslands and oak-hickory forests. A reduction in hunting and gathering mobility brought on by increased resource

patchiness probably fostered population growth and logically organized collector strategies (Brown and Vierra 1983:168; Stafford 1994:219-221). An increase in rough and ground stone tools, such as grinding stones, pestles, bannerstones, and grooved axes, marks a time of increased subsistence diversity (Griffin 1967:178). However, deer and hickory nuts, and at some locations aquatic resources probably dominated the diet (Stafford 1994:223). Middle Archaic horizons from the extensively-excavated Koster Site in the lower Illinois Valley contain chipped, rough and ground stone tools, diverse antler and bone tools, hearths, roasting pits, mussel steaming pits, shell dumps, shallow storage pits and evidence for rectangular structures (Brown and Vierra 1983:183-184). High quantities of fire-cracked or fire-burned rock at Middle Archaic base camps suggests intensive food processing, probably the extraction of hickory nutmeats and oil (Stafford 1994:221). Diagnostics of the Middle Archaic include points of the Large Side Notched, Stanley Stemmed, Eva, and Morrow Mountain clusters (Justice 1987:97-110). Side notched points of the Matanzas Cluster are also attributed to the Middle Archaic (Stafford 1994:227), though Justice (1987:119) places these points in the Late Archaic.

*Local Patterns.* The changes described above are suggested by Stafford's study of Archaic settlement patterns for the Wabash Lowland of southwestern Indiana. In contrast to the location of Early Archaic sites in upland areas as well as near rivers, Middle and Late Archaic sites were found to be predominantly located near major rivers or basin outlets (Stafford 1994:219). Stafford suggests that this shift in settlement pattern represents the initial development of a collecting strategy and lifestyle. A collecting strategy involves strategically located base camps or central places to which food resources from a more restricted territory are moved. Therefore, residential mobility is minimized. A similar pattern is reflected in the presence of exotic cherts. More exotic cherts, defined as being from more than 30 kilometers away, tend to dominate Early Archaic lithic assemblages in southwestern Indiana (Cantin 1988). However, during the Middle and Late Archaic Periods, lithic assemblages predominantly feature local cherts. Cantin (1988) interprets this difference as indicative of changes in mobility, which complements Stafford's study.

Within the White River Valley, Tomak (1983) has identified the Stalcup Phase. This phase is based on the presence of Four Mile points (Large Side Notched Cluster) and Brunswick points (Matanzas Cluster). Brunswick points are particularly abundant in Greene County and may be somewhat later than Four Mile points. Tomak suggests that the Stalcup Phase dates to sometime between 5000 and 2500 B.C. (1983:72). This range overlaps with some of the Late Archaic manifestations discussed below.

#### Late Archaic (4000 - 1000 B.C.)

*General Background.* The Late Archaic in the Midwest is widely known as a period of increasing complexity and diversity and as a time of transition between established Archaic patterns and new Woodland patterns featuring ceramics, food production, and mound building (Griffin 1983:249; Stoltman 1978:715). Larger sites with recurrent habitations suggest considerable population growth (Griffin 1983:249), which may be linked to the gradual return of cooler and wetter conditions and the spread of modern mixed-deciduous forests. Other general trends include increasing use of plant foods, increasing numbers of grinding stones, a greater variety of preserved faunal remains, the appearance of shell midden sites, long distance exchange

of raw materials and finished objects, and inclusion of exchange objects in burials (Griffin 1967:178-180; Griffin 1983:249; Kellar 1983:29). Early fiber-tempered ceramics appear in the Southeast by about 2000 B.C. (Griffin 1967:180), but ceramics do not appear in the Midwest until the end of the Late Archaic (Griffin 1983:249). Evidence for the cultivation of native plants as well as squash and gourd imports from the southeast is also indicated at the end of the Late Archaic (Ford 1974:401).

There are a number of named regional Late Archaic manifestations throughout the Midwest. One of the best known is the Helton phase, which is known from the Koster Site in the lower Illinois Valley. Helton phase artifacts include points from the Matanzas, Late Archaic Stemmed, and Table Rock clusters, T-shaped drills, full and three-quarter grooved axes, plummets, bannerstones, metates, and chevron-incised bone pins. A variety of hearths and roasting pits are found at Helton phase sites along with evidence of a rectangular house pattern. Some differences in burial treatment suggest the marking of status and in some cases; Helton phase burials contain exotic materials such as marine shell or copper (Griffin 1983:250; Brown and Vierra 1983:185; Munson and Cook 1980:734-736). By 2000 B.C. the Helton phase is replaced at Koster by the Titterington phase, which is defined by points from the Nebo Hill, Etley and Wadlow clusters (Sedalia, Etley and Wadlow points) (Brown and Vierra 1983:186). Titterington people are cited as having a well-adjusted economy that made equal use of floodplains, uplands, and areas between (Griffin 1983:250).

Riverton Culture sites (2000-1000 B.C.) have been identified as centered along the middle Wabash River by Winters (1969). However, scattered Merom Cluster points have been reported up the West Fork of the White River as far as Noblesville. Sites range from shell middens along the river to terrace top settlements with houses and prepared clay floors (Winters 1969:137). Merom Cluster points are diagnostic of the Riverton Culture along with the occurrence of Robeson gouges, grooved sinkers, limonite axes, "cloudblower" pipes, and Indian Knoll rattles. Winters looks south for Riverton antecedents, arguing against connections to the earlier "Wabash Valley Archaic" (Winters 1969:103-108). Ford (1974:395) includes the various Late Archaic manifestations discussed here in a larger mid-continent tradition called the Riverine Archaic.

*Local Patterns.* The French Lick phase (3000-1500 B.C.) has been defined for south-central and southwestern Indiana by Munson and Cook (1980). The phase incorporates riverine shell midden and non-shell midden sites including points from the Matanzas and Late Archaic Stemmed clusters. The French Lick subsistence/settlement system is characterized by summer and fall base camps along large creeks and tributary confluences, fall and winter camps along tributaries, and summer shell middens sites along large rivers (Munson and Cook 1980:723-730).

Tomak (1983:72) has defined the Scherschel Phase for the White River Valley based on materials that he has recovered from the Scherschel Site located in the uplands of Monroe County near Bean Blossom Creek. The site probably represents a recurrent, seasonally occupied base camp. Points from the site (Scherschel and Modesto points) generally fit into the Late Archaic Stemmed Cluster. The site also produced bifaces, scrapers, drills, grooved axes, hammerstones, prismatic bannerstones, and features with bone and nutshell. A nutshell from one feature yielded a radiocarbon date of 2645 +/- 90 B.C. (Uga-4549) and he generally places

the phase between 3500 and 1500 B.C. The Scherschel Phase seems well represented in the vicinity of Greene County. The archaeological reconnaissance of the U.S. 50, Washington Bypass in Daviess County revealed six Late Archaic sites. Three were situated in an upland setting and three were located on slight rises near old stream or river channels (Tomak 1979).

#### Early and Middle Woodland (1000 B.C. - A.D. 500)

*General Background.* Roughly simultaneous occurrence of ceramic manufacture, food cultivation, and artificial earthwork construction characterizes the Early and Middle Woodland periods in the Midwest. Following developments in the Middle Atlantic area, cord-marked ceramics such as Marion, Fayette, or Schultz Thick spread rapidly. More complicated indigenous ceramics with rocker and dentate-stamped decoration appeared during the Middle Woodland along with trade vessels from the southeast (Griffin 1967:184; Griffin 1983:254). Intensive hunting and gathering appears to have been supplemented by cultivation of squash and gourd and the indigenous cultigens sunflower, sumpweed, and goosefoot (Stoltman 1978:718; Ford 1974:401). Corn was adopted from the southwest much later, and became a regular (though not staple) part of Middle Woodland subsistence (Ford 1974:402).

Early Woodland peoples constructed earthen mounds for the dead throughout many parts of eastern North America. The most extensive form of this practice by Adena peoples took place in the Ohio Valley area (Griffin 1983:254). Cremation and inhumation burials have been found in villages and in accretional mounds built over the locations of circular "ritual" structures (Griffin 1983:258; Clay 1986:581). The distribution of Adena mortuary goods among adult males suggests the presence of graded, achieved statuses (Mainfort 1989:173). Mortuary goods include cut mica, copper beads and bracelets, stone gorgets, tubular stone pipes, stone effigy pipes, engraved stone tablets, bannerstones, marine shell, chert blades, and plain and decorated ceramics (Griffin 1983:258-259). Adena Stemmed points from the Dickson Cluster are diagnostic of Adena (Justice 1987:191-192). Smaller domestic sites, with strategic locations between valleys and uplands, characterize other Early Woodland complexes such as Black Sand in western Illinois (Griffin 1983:257).

After approximately 100 B.C. Middle Woodland Hopewellian regional complexes dominated the Midwest. Hopewell sites in Ohio include large and complex geometric earthworks and burial mound clusters (Griffin 1983:262-262). Mortuary goods reflect a wide sphere of interaction for Hopewell peoples. Copper, silver, galena, meteoric iron, quartz crystal, mica, obsidian, Ohio pipestone, and marine shell commonly appear in burials as raw materials or artifacts. Human and animal effigies in clay, on carved platform pipes or in cut mica are among the broad array of elaborate Hopewell artifact forms (Griffin 1967:184). Greber (1979) has identified some social divisions and "high ranking" individuals using mortuary data, but the structure of Hopewell society cannot be reliably inferred from the data (Griffin 1983:263). Havana Hopewell in western Illinois includes smaller mound burials and similar types of mortuary goods, though no geometric earthworks are present (Griffin 1983:268). A similar Hopewellian complex is known in western Michigan (Fitting 1978:47-49). Other mound building, stamped ceramic cultural complexes have been identified in the Great Lakes area, such as Laurel in Minnesota, northern Wisconsin, Michigan, southeastern Manitoba and western Ontario (Griffin 1983:271). Elsewhere, such as in northern Indiana, southeastern Michigan, and

northern Ohio, poorly understood Middle Woodland complexes await further clarification (Fitting 1978:47).

Aspects of Adena and Hopewell ceremonialism have been observed in Indiana. Crab Orchard Tradition Hopewell burial mounds such as the Mount Vernon Mound in Posey County (Tomak, 1990) are situated on high terraces and bluffs in southwestern Indiana. The Mann Site, a village/mound/ceremonial complex has been identified in Posey County (Kellar 1983:45-46). Radiocarbon dates from Mount Vernon Mound burial items yielded calibration curve intercepts between AD 80 and AD 60 (Beard 1997:263) Diagnostic artifact types for Adena sites in Indiana include Montgomery Incised ceramics, copper bracelets, cache blades, and Adena points from the Dickson Cluster. Hopewell diagnostics include various types of stamped ceramics, copper earspools, stone effigy pipes, and cache blades. Middle Woodland points from the Snyders and Lowe clusters (Snyders points and Lowe Flared Base points) are frequently found (Kellar 1983:41-45).

*Local Patterns.* The transition from the Late Archaic to Early Woodland in the White River Valley of southwestern Indiana is represented by five point types and Marion Thick Pottery (Tomak 1983:73). The Hasler Site in Greene County contained a burial as well as points from the Turkey-tail Cluster, red ochre, a birdstone, and celts. This site is fairly unique, i.e., Turkey-tail Cluster points are not common in the area (Tomak 1983:73). Another site in Greene County, the Hensley Site, defines the West Phase for the White River Valley (Tomak 1983:73-74). This site yielded cremated bone with red ochre, points, a drill, and a grooved stone tablet. Most of the points from this site are of the Black Creek type (leaf shaped), though one point fitting into the Dickson Cluster (Morgan point) was also recovered. Numerous other sites with Black Creek and/or Morgan points have been found in Greene County and Marion Thick-like ceramic sherds have been found in association. Tomak generally places the West Phase in the first millennium B.C. Points that fit into the Terminal Archaic Barbed Cluster (Lone Tree and Crooked Creek points) have also been identified in Greene County, though it is not clear how they relate to the West Phase.

Tomak (1983:74) also discusses the Worthington Phase, which represents Middle Woodland development in the White River Valley. The Worthington Mound in Greene County, which was destroyed in 1880, reportedly contained burials and cultural material. The cultural material included zoned rocker-stamped ceramics, a clay human figurine, and a copper celt. A few other sites in the vicinity of Greene County have produced artifacts that relate to the Worthington Phase, including Snyders-like points (Tomak 1983:74). Tomak suggests that the Worthington Phase dates to sometime around A.D. 1.

The Allison-LaMotte Tradition, originally defined by Winters (1963) for the Middle Wabash Valley, is present in the form of habitation sites in the West Fork of the White River Valley in Owen, Greene, Knox, and Daviess counties (Tomak 1983:75). Allison-LaMotte is generally characterized by oval structures, stamped ceramics, Lowe Cluster points, and increasing evidence for plant cultivation (Kellar 1983:50). Sites in the West Fork of the White River Valley include features, evidence for hillside middens, points from the Lowe Cluster (Allison/Lowe points), celts, rectanguloid gorgets, L-shaped stone pipes, and cordmarked and stamped pottery. Some sites include mortuary and non-mortuary mound groups. Based on

absolute dates from the Daugherty-Monroe Site in Sullivan County, Indiana, Tomak suggests that Allison-LaMotte in the West Fork of the White River Valley dates from approximately A.D. 200 to A.D. 600 (Tomak 1983:75).

#### Late Woodland and Mississippian (A.D. 500 - 1650)

*General Background.* The transition to the Late Woodland period is marked by the abrupt decline of florescent Hopewellian complexes, though in many areas no decline from established regional Middle Woodland patterns is seen (Stoltman 1978:721-22). The early Late Woodland in central and southern Illinois is characterized by cord-marked ceramics and small, scattered sites typical of a generalized economy. Similar cord-marked ceramics are also noted for western Michigan (Fitting 1978:54). The Newtown complex in southern Ohio and southeastern Indiana includes large villages with circular house plans. Lowe Flared Base points, Chesser Stemmed points, and cord-marked ceramics are characteristic (Griffin 1983:272-273). Villages of the Albee Complex are found in the middle to lower Wabash Valley. Excavation of an Albee cemetery revealed tools, beads, gorgets, and cord-marked ceramics with distinctive wedge-shaped rims (Kellar 1983:50). Botanical remains from the Albee Complex Morell-Sheets Site in west central Indiana suggest roughly equal use of maize and wild plants at a spring through summer occupation (Bush 1994:7).

Inhabitants of the Midwest became more intensely horticultural after A.D. 900 and established larger, more sedentary villages characterized by house clusters, storage pits, and stockades (Stoltman 1978:723-724). Such changes may be associated with the improved subsistence during the warming of the Secondary Optimum (A.D. 1000-1200), but the trend towards larger settlements is one that began earlier. In the American Bottoms in Illinois across from St. Louis the Cahokia Site represents Mississippian cultural florescence. During Cahokia's apogee (A.D. 950-1300) people engaged in the construction of enormous platform mounds and further evidence for social complexity is seen in elaborate mound burials (Griffin 1983:278-280). Cahokia was linked through cultural similarity and interaction to a number of independently derived expressions throughout the Midwest and southeast. As the largest Mississippian center, Cahokia is thought to have exerted considerable influence throughout this area and at its margins (Stoltman 1978:725; Griffin 1983:280-282).

*Local Patterns.* At least seven Late Woodland cemeteries with similarities to the Albee Complex exist in Greene and Knox Counties (Tomak 1983:76). Mortuary artifacts from these cemeteries include turtle shells, antler and bone implements, animal mandibles, celts, pipes, shell beads, and ceramic vessels. Points that fit into the Jack's Reef Cluster (Logan points) and the Late Woodland/Mississippian Triangular Cluster are also included. Though non-cemetery sites are known for the area, few extensively occupied habitation sites, if any, have been documented. Tomak places Albee-like occupations in the White River Valley between approximately A.D. 700 and 1200.

A limited number of Late Woodland sites in Greene County have been assigned to the Heaton Phase (Tomak 1983:76-77). These sites appear to be habitation sites with features and possibly some burials. The cultural material from these sites includes Late Woodland/Mississippian Triangular Cluster points, drills, celts, and grit and shell-tempered

ceramics. The grit-tempered ceramics in some cases resemble Fort Ancient ceramics. Overall the Heaton Phase resembles the Oliver Phase in central Indiana and probably dates to approximately A.D. 1000 to 1500.

The Angel, Murphy, and Vincennes complexes represent Mississippian cultural patterns in southwestern Indiana. The forty-hectare Angel Mounds Site and associated villages, hamlets, and camps are located in the southwestern tip of the state along the Ohio and Wabash Rivers. The Angel Mounds Site, located in Vanderburgh County, represents a palisaded town with platform mounds, plazas, rectangular house remains, and a main occupation date between 1200 and 1400 A.D. (Griffin 1983:283). Diagnostic artifacts include typically Mississippian ceramic bowls, bottles, plates and jars and small triangular arrow points. Some Angel vessels feature negative painted motifs and effigies (Griffin 1983:286-288). Distinctly less complex Mississippian sites of the Murphy and Vincennes complexes are located along the lower Wabash River in Illinois and Indiana (Griffin 1978:550). The Caborn-Welborn phase of Mississippian, with more dispersed and unfortified settlements, replaced earlier Mississippian occupations in the Ohio/Wabash area after A.D. 1450 and continues until the time of European exploration of eastern North America (Griffin 1983:288).

Little evidence for Mississippian occupations beyond the Ohio and Lower Wabash is available. In the White River Valley a few burial sites are reported for Greene and Daviess counties. One of the sites in Daviess County contained six burials accompanied by a shell-tempered ceramic vessel and other artifacts suggestive of the Caborn-Welborn phase (Tomak 1983:77).

#### Historic (ca. A.D. 1650 - Present)

Whereas most of the Late Woodland and Mississippian periods for Indiana provide a general image of cultural continuity, the region became relatively depopulated during the centuries before direct European contact (Hicks 1992:42). Population movements probably resulted from indigenous social and ecological factors as well as indirect impacts from European presence on the continent. Therefore, connections between prehistoric and later historic Native American populations in Indiana are not very clear. The Miami were established in Indiana by 1680 after being pushed east by conflicts with the Iroquois over the fur trade with the French and English (Barnhart and Riker 1971). The Wea, Piankashaw, Potawatomi, Kickapoo, and Delaware soon followed.

Among the first newcomers to what is today Indiana were French and Euro-American traders who entered the area in the late 1600s and early 1700s. England took control of the area from the French after victory in the French and Indian War in 1763. Following the Treaty of Paris and the end of the American Revolution (1783), the boundary of the United States was pushed west to the Mississippi. Title to the "Old Northwest" was thus gained (Carmony 1966:10). At the Treaty of Greenville in 1795, Chief Little Turtle claimed for the historic Miami, Potawatomi, and Wabash Indians all of the lands contained in Indiana, western Ohio, and the eastern edge of Illinois (Wheeler-Vogelin et al. 1974). He then sold over 25,000 square miles of this land to the newly formed United States government for about four cents an acre as part of the peace treaty. Subsequent Native American struggles to stop the transfer of land

resulted in armed resistance, which many felt was encouraged by the English from Canada. The destruction of the Shawnee village of Prophetstown during the battle of Tippecanoe in 1811 ensured the end of this resistance (Barnhart and Riker 1971). The conclusion of the War of 1812 secured stability on the frontier and opened the area to more rapid American settlement (Carmony 1966:20).

Indiana became the nineteenth state of the United States on December 11, 1816. By 1840, various remnant groups of Miami and Potawatomi signed treaties that ceded all but small reservation lands in Indiana to the Federal government. The strong desire of settlers to have Native Americans removed from the state was realized as nearly the last of these people were forced west (Carmony 1966:27).

*Clay County.* Clay County was organized in 1825 and named for Henry Clay, a party statesman for the Whig party. The county was formed from portions of Vigo, Sullivan, Putnam, and Owen counties. Brazil was named the county seat in 1877 (Taylor et al 1989).

*Daviess County.* Daviess County was organized on February 24, 1816, and named after Colonel Joseph H. Daviess who fell in the Battle of Tippecanoe in 1811 (Baker and Carmony 1975:39). The town of Washington, the county seat, was platted in 1815 under the name Liverpool, but changed shortly after to honor George Washington when the Indiana Territory became the nineteenth state in the Union in 1816. The Wabash and Erie Canal, beginning in Fort Wayne in 1832 and ending in Evansville by 1853, passed through the west side of the county, roughly following the flood plain of the West Fork of the White River. The canal provided a great improvement for the commerce in the county although only operational for three years.

*Gibson County.* The first white settler in Gibson County was John Severns who settled on the south bank of the Patoka River between 1789 and 1800. Gervas Hazelton was the next. The first town platted in the county was Smithville in 1813, later changed to Columbia, and finally Patoka. The second town was Hazelton. Gibson County was organized on April 1, 1813 while Indiana was still a territory, with Princeton selected as the county seat in February of 1814. The county was named after General John Gibson, Secretary of the Indiana Territory (Baker and Carmony 1975:60).

*Greene County.* The first settlers in Greene County were John Van Vorst and Daniel Carlin who came in the spring of 1818. Greene County was organized on January 5, 1821, with the first county seat at Burlington, and later moved to Bloomfield. The county was named in honor of General Nathaniel Greene of the Revolutionary War (Baker and Carmony 1975).

*Hendricks County.* Hendricks County was officially organized in 1823 although settlement began in 1820. The county is named for William Hendricks, who was the state governor when Hendricks County was organized. The northern and western parts of the county were the last to be settled, consisting primarily of swamps (Taylor et al. 1989).

*Johnson County.* In 1818, Jacob Whetzel began cutting a 60-mile trail from Laurel through what are now Franklin, Rush, Shelby, Johnson, and Morgan Counties, to the bluffs of the White River. This trail became the first east-west route through central Indiana, and

contributed greatly to the settlement of the area. The first permanent settler in Johnson County was John Campbell in 1820 (Banta 1886). The county was organized in 1822 with Franklin as the County Seat, and was named to honor Judge John Johnson, who served as one of Indiana's first Supreme Court Justices.

*Knox County.* Knox County was the first Indiana County to be organized. The county was organized in 1790 and was named for Maj. Gen. Henry Knox, a Revolutionary War artillery officer and Secretary of War from 1785 to 1794. At this early date the county extended to Canada and included parts of Indiana, Michigan, Illinois, and Ohio. The majority of the county consists of rich bottomlands from the valleys of both the Wabash and the White Rivers. Vincennes, the county seat, is the oldest city in Indiana. A French fort stood at Vincennes as early as 1732. An outpost and fur-trading center was established on the banks of the Wabash. The French traders were soon followed, in the 1750's, by immigrants from other French settlements (Taylor et al. 1989).

*Lawrence County.* Lawrence County was organized from a portion of Orange County in 1818. The county was named to honor Captain James Lawrence, who died in 1813 while fighting a British frigate on Chesapeake Bay (Taylor et al. 1989). The earliest settlers in the county came from Kentucky, moving north across the Ohio River. The first county seat was established at Palestine but was moved to Bedford in 1825 due to contamination of the water supply (Thomas 1985:1).

*Marion County.* The first settler in Marion County was George Pogue, a blacksmith from the Whitewater settlement (Connersville) who built a cabin near where Michigan Street crosses Pogues Run in 1819. In 1821 Indians killed Mr. Pogue. Next were the McCormicks who settled on the west bank of the White River. On January 11, 1820 the four year old State legislature, in Corydon, Harrison County appointed a ten man commission to select a site for a future capital. Five men accepted the task, and that spring traveled to the White River valley to select a site. A choice was made on the seventh of June 1820, and confirmed on January 6, 1821. The town was laid out in the summer of 1821 by Alexander Ralston, architect of Washington D.C. The county was organized on December 31, 1821 with Indianapolis the County Seat. The county was named in honor of General Francis Marion, a Revolutionary War hero. The state capital was moved from Corydon to Indianapolis by the Act of January 25, 1824. The first meeting of the legislature, in the still uncompleted State Courthouse, was held on January 10, 1825. By an act of the 1969 Indiana General Assembly the city limits of Indianapolis were extended to cover the whole county, except for small areas already incorporated.

*Martin County.* Martin County was organized in 1820 from portions of Dubois and Daviess Counties. The county is most known for its spectacular, irregular landscapes, which make the county attractive for recreational activities. One of the county's major industries is gypsum mining, which began in 1955 and continues today with the 515-foot shaft at shoals being the deepest in the nation (Taylor et al. 1989).

*Monroe County.* Monroe County was formed in 1818. The county was named for President James Monroe. The major industry of the county is limestone quarrying and stone

cutting; however, Indiana University remains the city of Bloomington's major employer (Taylor et al. 1989).

*Morgan County.* Morgan County was organized on December 31, 1831, with the county seat at Martinsville, and named after General Daniel Morgan, who fought in the War for Independence (Baker and Carmony 1975).

*Owen County.* The first white settlers in Owen County were David Thompson, Phillip Hart, Captain Bigger, John Dunn, and Robert Blair, arriving in the area around 1816 or 1817. Owen County was organized by an act of the State legislature in Corydon on December 21, 1818. The county was named in honor of Col. Abreham Owen of the Kentucky Rangers who was killed at the Battle of Tippecanoe on the 8<sup>th</sup> of November 1811 (Baker and Carmony 1975).

*Pike County.* Pike County was first settled by Woolsey Pride "who settled in the White Oak Springs area about 1800" (Struben 1987:2). The county was organized on December 21, 1816, with Petersburg selected as the county seat. The county was named after General Zebulon Montgomery Pike who was killed on April 27, 1813 at the capture of York in the War of 1812. Petersburg was laid out in 1817 and named after Peter Brenton who donated the land (Baker and Carmony 1975:128).

*Putnam County.* Putnam County was organized in 1821 by an act of the Indiana General Assembly. It is named for Major General Israel Putnam, a Revolutionary War officer (Taylor et al. 1989). Greencastle, the county seat of Putnam County, was named for Greencastle, Pennsylvania, the hometown of the earliest settler, Ephraim Dukes, who settled here in 1821 (Baker and Carmony 1975).

*Sullivan County.* Sullivan County was organized in 1816, at which time it encompassed large segments of present day Owen, Clay, and Greene Counties, and all of what is now Vigo County. Sullivan County was named in honor of Revolutionary War hero Daniel Sullivan, who was killed while delivering messages from Vincennes, IN to Louisville, KY. The town of Sullivan (originally named Benton) was laid out near the center of the county in 1846 for the purpose of serving as the county seat (Baker and Carmony 1975:160; Taylor et al. 1989).

*Vanderburgh County.* Vanderburgh County was organized from a portion of Warrick County on January 7, 1818, with Evansville as the county seat, and named after Henry Vanderburgh, a territorial judge. Boonville, platted in 1818 was then named the county seat for Warrick County after Ratiff Boon, an early settler and prominent politician.

*Vigo County.* Vigo County was formed in 1818 from a portion of Sullivan County and was named for Col. Francis Vigo. Vigo was a prosperous merchant, originally from St. Louis, who supplied George Rogers Clark. The area was first settled in 1811 with the construction of Fort Harrison. Settlement of the area began officially in 1816, the same year that the city of Terre Haute was established. Terre Haute was named the county seat in 1818.

*Warrick County.* In 1801 Indiana Territorial Governor William H. Harrison began a series of purchases from the Indians by treaty. Warrick County was included within one of these

treaties, negotiated in Vincennes on August 18, 1804 by the chiefs of the Delaware, and concurred by the Piankashaw on the 27<sup>th</sup> of that same month. This treaty line generally followed along the Buffalo Trace, called by the Miami the “Lan-an-zo-ki-mi-wi”, and also known as the Kentucky Road, Vincennes Trace, or Harrison’s Road. This well-worn path, created over centuries by huge herds of buffalo, was in many places as wide as 20 feet. It began in Indiana at the Falls of Ohio and left Indiana near Vincennes. The trace became one of the main overland routes for both the Indians and the early settlers into the area (Wilson 1986).

Warrick County was organized on March 9, 1813 and named to honor Captain Jacob Warrick, who was killed leading his men in the Battle of Tippecanoe at Prophetstown in 1811 (Baker and Carmony 1975:173). It was formed from a portion of Knox County south of “Rector’s Base Line” and extended from the boundary of Harrison County to the Wabash River. The original county seat was in Evansville but this lasted less than a year. The 1814 Indiana territorial legislature divided Warrick County, creating Posey County on the west, and Perry County on the east, and the county seat was moved to Darlington.

## ARCHAEOLOGICAL RECORDS CHECK

### Methods

The archaeological records check primarily focused on documents obtained from the Indiana Department of Natural Resources, Division of Historic Preservation and Archaeology (IDNR, DHPA). These documents included both paper and computer generated archaeological site records, regional archaeological syntheses, individual archaeological reports, and USGS 7.5 minute series maps showing recorded archaeological site locations. In order to facilitate the analysis of these records it was determined that a computerized database of archaeological resources needed to be created. Although IDNR, DHPA began computerization of the volumes of paper site forms several years ago with the use of FileMaker Pro 5.5 software, many of the recorded site descriptions and locations were found to be incomplete. Therefore, it was necessary for this project to create a new archaeological database and to repair many of the records prior to conducting any of the analyses. For this database it was decided to utilize only the site number, corresponding UTM coordinate data, eligibility status, and cultural period designation in an effort to thematically represent the recorded sites as Historic, Prehistoric, Both or None. Using only the site identification and geographic position data would reduce the errors and provide a baseline thematic representation and GIS geographic depiction of recorded sites within the study area. Sites with incomplete or no UTM coordinates were corrected manually using paper records and reports. Sites with multiple UTM coordinates were assigned a single easting and northing site center. UTM coordinates in NAD 1927 were batch converted to match GIS base maps in the NAD 1983 datum using Corpscon 5.11. The database was then converted to tab delimited .txt format for subsequent exporting as an ArcView table.

Other supplemental sources were also examined as part of the archaeological records check for this project and any information gained from these sources was added to the GIS archaeological database. These sources included various historic maps as well as information

collected from the Indiana State Library, county histories, university libraries, private library collections, Landmark files, and many peer sources.

### Results

Over 14,852 recorded prehistoric and historic archaeological sites, plus numerous historic cemeteries, canal structures, abandoned limestone, coal, and gypsum mineral quarries, historic trails, roads, and railroads have been found in the records within the counties traversed by this project. Of these sites, 1924 were found to be located within the five, 2-mile wide study bands, 427 were found to be located within the 2000-foot wide corridors, and only 139 were found to be located within the working alignments.

One archaeological site, which had the potential for inclusion to the National Registers of Historic Places, was identified early in this study. This site, known as the Virginia Iron Works (12-Mo-158), contains the remains of a pre-civil war iron furnace. A subsequent letter from the IDNR, DHPA confirmed that this site did indeed appear to be eligible for inclusion to the National Register of Historic Places and, as a result, the working alignment of Alternate 3 was shifted and the corridor widened to the west to avoid compromising the environs of this significant archaeological site.

Tables 1, 2, and 3 provide a more detailed breakdown of the eligibility and cultural affiliation of the sites found in the study bands, corridors, and working alignments for this project. In addition, a detailed listing of all 1924 previously recorded archaeological sites found within the five, 2-mile wide study bands can be found in the Appendix.

As stated above, a total of 427 previously recorded archaeological sites were found to be located within the 2000-foot wide corridors of the alternatives under consideration in this report. A more detailed description of these corridors and sites is given below. Note that because so many of the alternatives overlap, a lot of the archaeological sites are counted more than once.

### *Alternative I*

This most western alternative begins at I-64 and SR 41 at the Vanderburgh and Gibson county line and runs northward through Gibson, Knox, Sullivan and Vigo Counties where it follows the proposed SR 641 project to the existing interstate I-70. The alternative follows existing I-70 through Clay, Putnam, Morgan and Hendricks counties to I-465 in Marion County. Because so much of this alternative is on existing alignments constructed prior to federal requirements for archaeological investigations, only sixty-seven (67) previously recorded archaeological sites were found to be within the corridor examined for this alternative. Thirty-four (34) of these sites are prehistoric, twenty-one (21) are historic sites, six (6) have both historic and prehistoric components, and six (6) are of undetermined cultural affiliation. In addition, one site that is listed on the National Register of Historic Places (12-K-14) is also located in this corridor near the Hart Street exit along US 41. This site is called Pyramid Mound and is a Middle Woodland burial mound that also contains Late Woodland (Yankeetown) components.

### *Alternatives 2A, 2B, & 2C*

Alternative 2 begins at I-164 and SR 41 at the Vanderburgh and Gibson county line and runs northward through Gibson into Knox County to Vincennes, as did Alternative 1. From Vincennes it veers northeastward through Greene County, into Owen County where it splits with Alternative 2A continuing northward while 2B, and 2C turn eastward into Morgan County.

Alternative 2A from Owen County continues northward entering Putnam County where it connects into I-70 east of Cloverdale, then follows I-70 alignment eastward into Morgan, Hendricks, and Marion Counties connecting to I-465. This alternative involves a total of one hundred and one (101) previously recorded archaeological sites. Sixty-four (64) of these sites are prehistoric, fifteen (15) are historic, eleven (11) have both historic and prehistoric components, and eleven (11) are of undetermined cultural affiliation. In addition, Pyramid Mound (12-K-14) is also located in this corridor and is listed on the National Register of Historic Places.

Alternative 2B in Owen County turns eastward into Morgan County, and then turns north near Paragon to tie into I-70 east of Crown Center in Morgan County near the Hendricks County line. The alternative follows I-70 northeastward to connect with I-465 in Marion County. Alternative 2B involves a total of one hundred and twelve (112) previously recorded archaeological sites. Seventy-four (74) of these sites are prehistoric, seventeen (17) are historic, ten (10) have both historic and prehistoric components, and eleven (11) are of undetermined cultural affiliation. In addition, Pyramid Mound (12-K-14) is also located in this corridor and is listed on the National Register of Historic Places.

Alternative 2C in Owen County follows the same alignment as 2B eastward into Morgan County, but continues past Paragon to tie into SR 37 south of Martinsville. This alternative continues northeastward to split again south of Waverly into Marion and Johnson counties, connecting with I-465 west of the present SR 37 interchange, both west and east of the White River channel. This alternative involves one hundred and forty-five (145) previously recorded archaeological sites, one hundred and four (104) of which are prehistoric, eighteen (18) are

historic, eleven (11) have both historic and prehistoric components, and twelve (12) are of undetermined cultural affiliation. In addition, Pyramid Mound (12-K-14) is also located in this corridor and is listed on the National Register of Historic Places.

#### *Alternatives 3A, 3B, & 3C*

Alternative 3 begins at the junction of I-64, I-164, and SR 57 at the common corners of Warrick, Gibson and Vanderburgh counties in Gibson County and heads northeastward into Warrick County, then back into Gibson County, through Pike County to the town of Washington in Daviess County. The alternative then bypasses Washington to the east and continues northeast and then north until just north of Elnora. At this point it heads due east entering into the hills of eastern Greene County where it swings south of the American Bottoms and branches into two alignments 3A/3B, and 3C.

From southeastern Greene County Alternative 3A and 3B head along the Greene and Monroe County line in Greene County almost to Owen County where it turns northeastward entering Monroe County west of Bloomington. In northern Monroe County the alignment branches again with Alternative 3A heading due north west of Paragon in Morgan County, to tie into I-70 just east of Crown Center, near the Hendricks County line. It then follows existing I-70 through Hendricks County to connect with I-465 in Marion County, Indianapolis. Alternative 3A involves one hundred and fifty-three (153) previously recorded archaeological sites, of which one hundred and twenty-two (122) are prehistoric, six (6) are historic, fifteen (15) have both historic and prehistoric components, and ten (10) are of undetermined cultural affiliation.

Alternative 3B in Greene County follows Alternative 3A into northern Monroe County then branches in a northeast direction essentially following existing SR 37 to split again south of Waverly into Marion and Johnson counties, connecting with I-465 west of the present SR 37 interchange, both west and east of the White River channel. Alternative 3B shows a total of one hundred and ninety-nine (199) previously recorded archaeological sites within its corridor. Of these sites, one hundred and sixty-seven (167) are prehistoric, six (6) are historic, fifteen (15) have both historic and prehistoric components, and eleven (11) are of undetermined cultural affiliation.

Alternative 3C in Greene County at the Monroe County line heads east to connect with SR 37 south of Bloomington, and then essentially follows SR 37 through Monroe, into Morgan County where it splits south of Waverly into Marion and Johnson counties, connecting with I-465 west of the present SR 37 interchange, both west and east of the White River channel as did Alternates 2C and 3B. Alternative 3C has one hundred and ninety (190) total previously recorded archaeological sites within its corridor. Of these sites, one hundred and fifty-eight (158) are prehistoric, six (6) are historic, sixteen (16) have both historic and prehistoric components, and ten (10) are of undetermined cultural affiliation.

#### *Alternatives 4A, 4B, & 4C*

Alternative 4 begins at the junction of I-64, I-164, and SR 57 in Gibson County. The alternative heads northeastward into a corner of Warrick County, then goes back into Gibson

County, through Pike County to the town of Washington in Daviess County. The alternative then bypasses Washington to the east and continues northeast and then north, entering Greene County and crossing the meandering channel of the White River. It continues north to Lyons before turning northeastward and traveling through broad bottomlands to Worthington where it crosses the Eel River entering uplands into Owen County. Alternatives 4A, 4B and 4C continue northeastward west of Spencer to northeast Owen County where the common alignment ends with Alternative 4A continuing northward while 4B and 4C turn eastward into Morgan County.

Alternative 4A from Owen County continues northward entering Putnam County where it connects into I-70 east of Cloverdale, then follows I-70 alignment eastward into Morgan, Hendricks, and Marion Counties connecting to I-465. Alternative 4A involves a total of one hundred and sixty-six (166) previously recorded archaeological sites. One hundred and thirty-five (135) of these sites are prehistoric, seven (7) are historic, eighteen (18) have both historic and prehistoric components, and six (6) are of undetermined cultural affiliation.

Alternative 4B in Owen County turns eastward into Morgan County, and then turns north near Paragon to tie into I-70 east of Crown Center in Morgan County near the Hendricks County line. The alternative follows I-70 northeastward to connect with I-465 in Marion County. Alternative 4B involves a total of one hundred and seventy-seven (177) previously recorded archaeological sites. One hundred and forty-five (145) of these sites are prehistoric, nine (9) are historic, seventeen (17) have both historic and prehistoric components, and six (6) are of undetermined cultural affiliation.

Alternative 4C in Owen County follows the same alignment as 4B eastward into Morgan County, but continues past Paragon to tie into SR 37 south of Martinsville. This alternative continues northeastward to split again south of Waverly into Marion and Johnson counties, connecting with I-465 west of the present SR 37 interchange, both west and east of the White River channel. This alternative involves two hundred and ten (210) recorded archaeological sites, one hundred and seventy-five (175) of which are prehistoric, ten (10) are historic, eighteen (18) have both historic and prehistoric components, and seven (7) are of undetermined cultural affiliation.

#### *Alternatives 5A &5B*

Alternative 5 begins at the junction of I-64, I-164, and SR 57 in Gibson County heading northeastward through a corner of Warrick County then back through Gibson County and Pike County into Daviess County southeast of Washington where it turns eastward. The common alignment essentially follows along US 50 into Martin and Lawrence Counties, then north along SR 37 through Monroe County into southern Morgan County where it branches into Alternatives 5A and 5B south of Martinsville.

In Morgan County south of Martinsville Alternative 5A continues north across the White River bottoms to follow essentially follow along SR 67 west of the White River to south of Mooresville where it leaves the existing path on new alignment north and west of Mooresville to connect with I-70 in Hendricks County. The alignment then uses existing I-70 northeast connecting in with I-465 in Marion County. This alternative involves a total of one hundred and

nineteen (119) recorded archaeological sites. Ninety-three (93) of these sites are prehistoric, six (6) are historic, nine (9) have both historic and prehistoric components, and eleven (11) are of undetermined cultural affiliation.

Alternative 5B continues along SR 37 east of Martinsville northeast to split again south of Waverly into Marion and Johnson counties, connecting with I-465 west of the present SR 37 interchange, both west and east of the White River channel. This alternative involves a total of one hundred and forty-seven (147) recorded archaeological sites. One hundred and twenty (120) of these sites are prehistoric, seven (7) are historic, nine (9) have both historic and prehistoric components, and eleven (11) are of undetermined cultural affiliation.

#### *Archaeological Sites along Existing I-70*

Fifty-six additional archaeological sites were found to be located along existing I-70 within 150 feet of the centerline of the Interstate. These sites are located in Vigo (6), Clay (8), Putnam (3), Hendricks (11), and Marion (28) counties and include forty- seven (47) prehistoric sites, seven (7) historic sites, and two (2) sites that have both historic and prehistoric components.

### GIS-BASED ARCHAEOLOGICAL ANALYSIS

The GIS-based archaeological analysis was conducted to identify areas within each of the five, 2-mile wide study bands that have a high to medium potential to contain archaeological resources. In order to be compatible and build upon the existing INDOT geographic database "Southwestern Indiana GIS 2001" (BLA et al. 2001) we began our analysis using ArcView 3.2, desktop GIS software produced by Environmental Systems Research Institute (ESRI). This GIS mapping, management, display, query and analysis of spatial information software tool established the core of our GIS-based analysis. Two specialized software extension components were added: ArcView Spatial Analyst "ModelBuilder" provides critical analytical tools to empirically design and adjust environmental modeling parameters at will. It also makes possible the interactive use and sharing of models and subsets of models created during the study. ArcView 3D Analyst extension was also included for surface modeling and analysis, as well as presentations in 3D.

From peer input throughout Indiana and a literature review of GIS predictive modeling methodologies in other states it was determined essential to acquire certain geographic data sets for the southwestern Indiana study area. Much of the data required did not exist or was not available in the right format or scale to be used in a GIS-based analysis of the project area. Land Info, Inc. of Aurora, Colorado was selected as the project source for the creation of the following GIS data sets: 1.) 10 x 10-meter Digital Elevation Model (DEM) maps georeferenced in UTM NAD 83 and tiled by county; 2.) 7.5 minute Digital Raster Graph (DRG) maps georeferenced in UTM NAD 83 and tiled by county; and 3.) Selected digitized vectored soil maps georeferenced in UTM NAD 83 and configured by county.

During the draft (DEIS) Tier 1 study, the archaeological investigators set out to complete a comprehensive archaeological records check of the project area; to define the Geographic Information System (GIS) data sets essential to the archaeological analysis; to assemble or develop GIS compatible data, modeling software, and suitable methods enabling comparisons of potential archaeological resources within the I-69 alternatives. These goals have been attained in the final EIS, resulting in a document that incorporates refinements to the GIS-based archaeological analysis from comments by the INDR, DHPA, consulting parties, and professional archaeologists throughout Indiana.

### Prehistoric Site Potential Analysis

#### *Methods*

Prefacing a description of the methods used in the prehistoric archaeological analysis of the proposed I-69 alternatives, it is important to note that this study has not set out to make statistical determinations of environmental variables that coincide with recorded archaeological sites. The path of this research is intended to establish a deductive GIS analysis that can be utilized to assist in planning and that creates a basis for future efforts to model the potential for prehistoric archaeological sites in southwestern Indiana. From this initial framework, researchers may generate larger and more inclusive samples of field-tested and confirmed physical evidence that will sufficiently add to the regional archaeological record. A more comprehensive database may ultimately permit the statistical definition of localized environmental variables and make the advent of an archaeological site predictive model more plausible.

Throughout this undertaking GIS and supporting software have been used extensively to analyze the spatial associations of environmental data. In addition to ArcView GIS, two supplementary software applications were applied to facilitate the analysis of spatially related data. The ESRI ArcView Spatial Analyst extension with ModelBuilder feature has enhanced the capabilities of this work by providing critical analytical tools and enabling Landmark researchers to empirically design and adjust environmental modeling parameters in an efficient manner. R2V, a raster to vector conversion program created by Able Software, Inc., has been used in support of the GIS software components and was integral in the creation and georeferencing of ArcView compatible shapefile data from scanned map images.

The Prehistoric Site Potential analysis for the Final Tier 1, I-69 EIS involved processing twelve permutations of the original five proposed alternative study bands encompassing an area exceeding 2500 square miles. All project areas were subjected to the same level of analysis with the exception of a small single segment of Alternative 1 in Sullivan County<sup>1</sup> where it was not possible to use soil drainage properties as part of the study due to georeferencing difficulties.

---

<sup>1</sup> The Sullivan County, Indiana soil survey lacks adequate geographic reference in its present published form. This problem is exacerbated by sections surveyed in the southern part of the county that were done as part of or in line with the early French reservation survey. Exhaustive attempts to georeference the Sullivan County soil maps to a resolution on par with the rest of the data used in this analysis failed. This area therefore does not include soil drainage characteristic data and was analyzed with the two remaining subsets of the Prehistoric Site Potential model only.

Spatial models that depict early human settlement and resource utilization patterns have been constructed with ModelBuilder using environmental characteristics derived from regional GIS data and digital maps. Widely varying environmental resources within the I-69 study areas necessitate the use of somewhat broad parameters to best address all regions of the study. Three criteria (Figure 2) were selected for analysis: soil drainage classification, percentage of slope, and distance-to-water. The spatial data resulting from chosen environmental characteristics has been weighted and combined to create areas with varying degree of potential for prehistoric archaeological sites within the I-69 study bands.

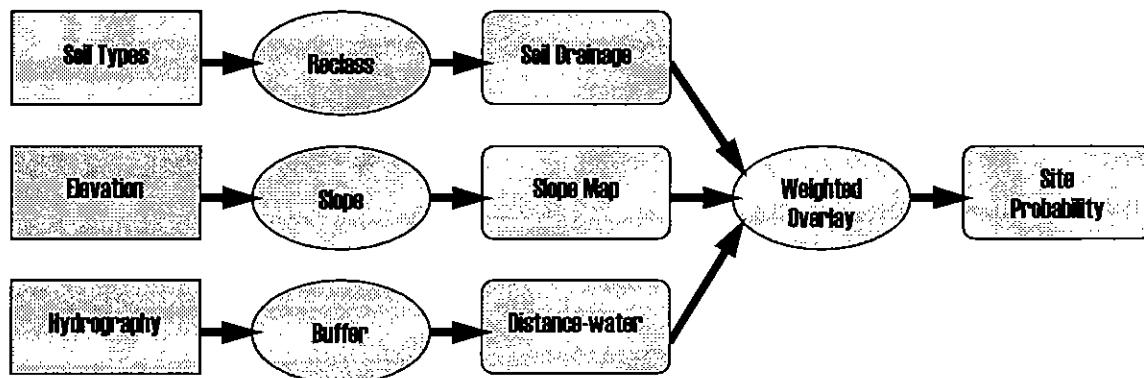

Figure 2: Prehistoric archaeological site potential analysis diagram.

Prior to this research, GIS data of an adequate resolution to carry out a study of this extent did not exist for Indiana in the public domain. Custom data sets were assembled by Landmark including digitized and georeferenced soil survey maps with which to identify soil drainage characteristics; 10-meter Digital Elevation Models (DEM) to derive percentage of slope; and a custom hydrography layer that represents sources of water including all rivers, streams and drainages.

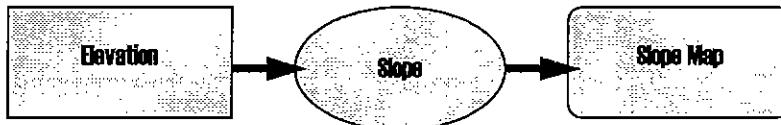

Soil types found within I-69 study bands have been reclassified by drainage properties into three distinct groups (Figure 3). Somewhat excessively drained, excessively drained and well drained soils are classified as having high potential (3); moderately drained and somewhat poorly drained soil types with a medium potential (2); and poorly drained, as well as very poorly drained soils are designated as having low potential (1) for sustained habitation. Areas of mining, mine spoils, and or other modern disturbances have been given the restricted classification of (0) and are purposely omitted in the results of this procedure.

	Existing Class Value	New Class Value	Label
	AfcC	3	High
	AfeD	3	High
	AfE	3	High
	AfsB	3	High
	AfsC	3	High
	AfD	3	High
	AloB2	2	Med
	BdwAH	2	Med
	BgeAH	1	Low
	CkkB2	2	Med
	CkkC2	2	Med

Figure 3: Soil classification analysis diagram and example table.

Data depicting percentage of slope, a derivative of the 10-meter DEM data, has also been weighted in three classifications (Figure 4). Areas with a 0-8 percent slope are considered the most likely places for human habitation and are given the highest priority with a weight of (3); 8-15 percent slopes (2), and all areas with a slope exceeding 15 percent are classified with a value of (1).

	Class Start Value	Class End Value	New Class Value	Label
	0	8	3	0-8
	8	15	2	8-15
	15	100	1	15-100

Figure 4: Deriving slope from elevation analysis diagram and table.

Likewise the custom hydrography layer<sup>2</sup> has been created by defining areas with three weights (Figure 5). The areas given a high priority weight of (3) consist of those closest to water sources. A 15-250 meter buffer zone designates this area. Distances from 250-500 meters are given the weight of (2), and lastly a distance-to-water buffer of 500-2500 meters is considered lower priority and assigned a weight of (1) for the purpose of this study.

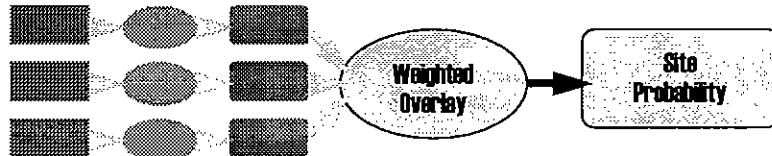

<sup>2</sup> The hydrography data layer is comprised of a series of vector (line) shapefile data that represent the centerline of each water source regardless of the actual size and width. The lower limit of the (3) weight buffer was arbitrarily chosen to provide an average distance from any given watercourse centerline.

	Start Distance	End Distance	Buffer Value	Label
✓	15	250	3	15 - 250
	250	500	2	250 - 500
	500	2500	1	500 - 2500

Figure 5: Distance-to-water buffer analysis diagram and table.

Finally, the results of the three models defining these discrete environmental characteristics within I-69 study bands were overlaid by ModelBuilder and again weighted as illustrated in the diagram and table of Figure 6. Initially, it was determined that each resultant model subset be given equal weight at this stage of the process; however, ModelBuilder requires that the sum of all legs of the model be equal to 100 percent. For this reason, the slope data results were given 34 percent weight while the remaining two subsets were each designated with a weight of 33 percent.

Input Theme	% Inf	Input Field	Input Label	Scale Value
Dist-Water	33	Value	15 - 250	3
		Value	250 - 500	2
		Value	500 - 2500	1
Slope Map	34	NODATA	No Data	Restricted
		Value	0 - 8	3
		Value	8 - 15	2
Soil Drainage	33	NODATA	No Data	Restricted
		Value	High	3
		Value	Med	2
		NODATA	No Data	Restricted
		Value	Low	1
		NODATA	No Data	Restricted

Figure 6: Weighted overlay and site probability diagram and table.

Site probability, for the purpose of this study, is defined by areas within the I-69 study bands that meet all of the criteria set out in the (Figure 6) table. The resultant Site Probability theme is created as an output function of ModelBuilder with shaded polygon areas designated as having High, Medium or Low potential for the presence of prehistoric archaeological sites. Areas of potential found within each of the twelve alternative study bands were then segregated by type and expressed as a percentage of total alternative area. The areas represented as having

High potential for prehistoric archaeological sites are thought to be the most archaeologically sensitive having averaged at the most significant level of environmental criteria established for the purpose of this research.

### *Results*

The results of the Prehistoric Site Potential Study are listed in Table 4 and data depicting high potential for prehistoric archaeological sites as a percentage of total alternative area are illustrated in the bar graph that follows in Figure 7.

Table 4. Prehistoric archaeological site potential results.

Criteria	Alternatives											
	1	2A	2B	2C	3A	3B	3C	4A	4B	4C	5A	5B
% High (3)	50.96	37.68	38.38	42.26	41.00	43.45	43.39	39.22	39.82	43.11	44.93	47.16
% Med (2)	43.22	55.35	54.77	50.27	52.07	48.62	47.76	53.73	53.49	49.59	45.21	42.88
% Low (1)	0.07	0.34	0.29	0.22	0.24	0.21	0.17	0.28	0.24	0.18	0.15	0.11
% None (0)	5.75	6.63	6.56	7.25	6.69	7.72	8.68	6.77	6.45	7.12	9.71	9.85

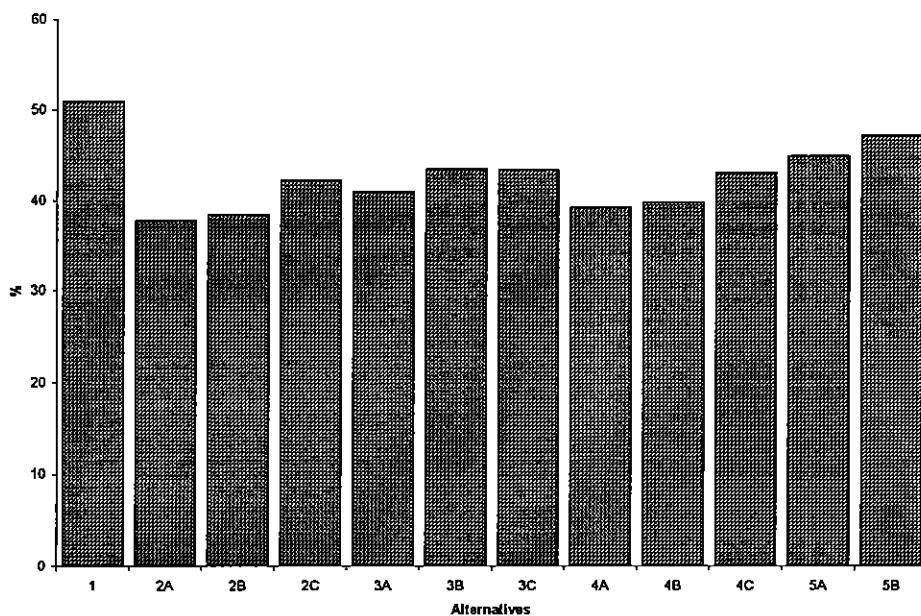

Figure 7: High potential for prehistoric archaeological sites.

It is important to remember that Alternative 1 had to be dealt with in a slightly different manner than all other areas of study inasmuch as soil classification data was incomplete in the Sullivan County segment. Without soil data from this area to use in analysis of this part of the alternative, the resultant data derived from combining only the slope and hydrography subsets is perhaps overall higher, at 50.96 percent, than it otherwise may have been. With respect to all other alternatives, it is apparent that Alternative 2A and 2B contain the least amount of high potential area, while 5A and 5B represent the areas with the highest percentage. The remaining

alternatives are very close in the percentage of area that is considered sensitive with a narrow range of between 39.22 and 43.45 percent high potential for prehistoric archaeological sites.

### Historic Site Potential Analysis

#### *Methods*

The historic archaeological site potential analysis has been designed, in part, after criteria developed in a similar study on an adjacent segment of the I-69 corridor in Kentucky (Linebaugh 2002). Dr. Linebaugh's model, to some extent, assesses historic archaeological site sensitivity using historic maps to determine potential site proximity, both to historic transportation routes and to known historic architectural resources. A variation of this study has been adapted to work within the GIS program environment established by Landmark for this study. The spatial relationship of digitized and georeferenced historic map features may be investigated in this manner, permitting an evaluation of the results as a percentage of total alternative area, much the same as in the prehistoric site potential analysis accomplished during this research.

For the purpose of this historic site potential analysis, areas thought to have a high potential for nearby historic sites are found within 100-meters (328 ft.) of mapped and or identified historic structures. Expanding somewhat on this concept, urban areas consisting of clustered historic structures are also afforded a 100-meter buffer zone. Likewise similar to the Linebaugh study parameters, areas considered to have medium historic site potential are found within 100-meter proximity of historic transportation routes. Cemeteries, considered to be of an importance that suggests avoidance, are included in a separate section of this research.

In order to assess the level of historic site potential in each I-69 alternative study band, it was first necessary to assemble digitally formatted historic data sets in the three specified categories including GIS framework depicting early transportation routes, mapped historic structures, and finally, all current and historic cemeteries.

#### Transportation

Much of the transportation data utilized in this analysis was created using raster-to-vector conversion software to scan, digitize and georeferenced 18<sup>th</sup> and 19<sup>th</sup> century maps and atlases (E. Y Guernsey 1968 [1932]), (Indiana Historical Society 1968 [1876]). Data layers developed to analyze historic transportation routes include period roads, railroads, canals and where possible early Indiana trails. In some cases, historic maps considered significant for examination of historic transportation and other historically important features were drawn at a scale that made GIS registration untenable (Tanner 1987) (Wilson 1991[1919]). Once assembled in an ArcView compatible shapefile format, linear vector data representing historic transportation layers have been expanded by a 100-meter buffer. Subsequently, the aggregate medium historic site potential area within each study band has been computed and expressed as a percentage of the total alternative area. (See table 5).

## Historic Structures

Historic structures data including schools, farms, churches, mills, government and industrial sites, ferries and other kinds of historic resources were also gleaned from historic period maps and formatted for thematic GIS analysis. Additionally, contemporary historic structures data, created and verified by Weintraut and Associates, Inc. during the Draft EIS have been incorporated with this element of the Landmark study. All historic structures are recorded with UTM coordinates typically representing a single central point location of each site or feature. These points, in turn, are modified to include a 100-meter buffer zone and are considered as high potential areas for historic sites. Again, the sum of all such areas within each study band has been computed and expressed as a percentage of the respective total alternative area (Figure 8).

## Cemeteries

Pioneer cemeteries, particularly small and less well known early to mid nineteenth century family plots, may be found widely distributed across the southwestern Indiana rural landscape. Many of these early Indiana cemeteries exist well off the beaten path and may not be identified on contemporary maps. Only locals know some and/or other interested parties such as historians, genealogists and cemetery preservationists. It was determined that these often obscure but important Indiana cemeteries needed to be identified and included in the cemetery site inventory for the archaeological GIS-based analysis. Table 4 depicts the number of cemeteries in each alternative and a graphic summary of the cumulative findings is found in (Figure 9) later in this section.

In conjunction with conventional methods of records research, and as a function of the Section 106 process, Landmark solicited consultation from regional sources including the County Historians of southwestern Indiana, and the Indiana Pioneer Cemetery Restoration Project (INPCR), an Indiana group dedicated to the preservation of early Indiana pioneer cemeteries. To make this same appeal for cemetery information to the general public, Landmark posted a statement and request for information on the Internet, and made available for download and comment maps depicting proposed I-69 alternatives. Parties responding to these requests for assistance were provided with more detailed maps, either electronically or in paper form. Landmark personnel assembled GIS data layers by county including the appropriate USGS topographical maps with all respective I-69 alternatives overlaid thematically. For volunteers requesting paper maps, Landmark provided D-size (24 x 36-inch) topographic maps representing areas of interest delineated by corresponding alternative study bands. Data in electronic format was distributed to interested parties on Compact Disc along with ArcExplorer, the freely distributable GIS viewing application produced by ESRI. Researchers assisting in the identification of cemeteries were thus able to select the coordinates of cemetery sites from the detailed topographic maps and to submit these locations on forms provided by Landmark along with any other pertinent information describing current site conditions.

The background records search carried out by Landmark utilized numerous sources in the attempt to record all known historic cemeteries within the I-69 study band alternatives. Landmark researchers acquired copies of all pertinent information on file in the office of the

IDNR, DHPA from the Cemetery and Burial Ground Registry records. The next step in the process involved development of a spatial database using ArcView GIS software to record a single set of UTM point coordinates at the approximate center of all named and unnamed cemeteries found on USGS 7.5 minute topographic quadrangles that also fall within study band alternatives. If a cemetery was only partially intersected by a study band extent, its center coordinates were adjusted to ensure inclusion in the database. Also, relevant County Interim Reports, where available, were examined by Landmark for references and locations of cemeteries.

Data collected and submitted by volunteers was assembled and considered for integration within the cemetery database. This data ranged in form from UTM coordinates and other descriptions in Microsoft Excel spreadsheet files, to verbal “driving” directions, to paper and internet sources provided by county historical and or genealogical societies, to hand plotted locations on USGS topographic quadrangles, to maps of cemeteries drawn in 1939-1940 by WPA workers. This data was compared and cross-referenced, county-by-county and township-by-township, to the data earlier gleaned from traditional sources. In many cases, it was possible to determine the names of cemeteries from this volunteer information for those cemeteries that are unnamed on the topographic quadrangles. In some instances, additional sites and or other names for cemeteries were identified.

Unmarked cemetery locations provided in the volunteer information were also compared and cross-referenced to obtain the most accurate location possible. However, many of these unmarked cemeteries have been listed as “exact location unknown”. Sites designated in this fashion consist of discrepancies as to location; no visible surface features or that may have been listed as “destroyed”. The location coordinates of these kinds of reported sites are therefore only approximate and further work will be needed in any future stages of investigation to determine more definitive locations.

### *Results*

The results of the historic site potential analysis are illustrated in Table 5. Alternative 1 is characterized by the greatest percentage of area having both high and medium level potential for historic archaeological sites; however, it should be noted that this alternative study band consists of the least overall area given that the total area subjected to study only extends from near I-64 in the south to Terre Haute in the north.

Table 5: Historic site potential table.

Criteria	Alternatives											
	1	2A	2B	2C	3A	3B	3C	4A	4B	4C	5A	5B
% High	3.46	2.13	1.98	1.96	1.49	1.59	1.82	1.49	1.39	1.47	1.94	1.93
% Med	21.92	16.98	17.28	17.67	16.86	17.34	17.54	17.09	17.35	17.70	18.56	18.77

An examination of the remaining alternatives, and the corresponding percentage of area deemed as having high potential for historic archaeological sites indicates that there again exists a relatively narrow differential ranging from between 1.39 and 2.13 percent.

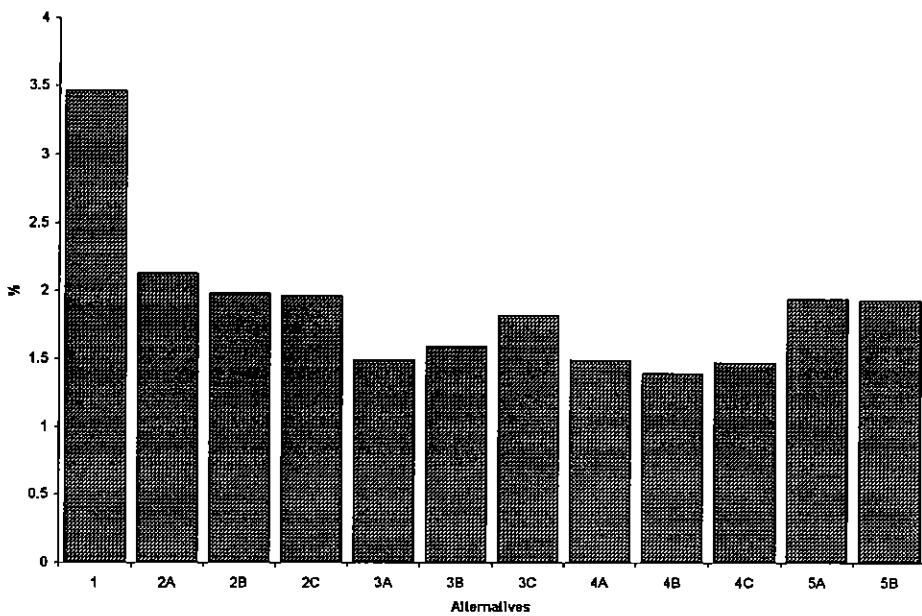

Figure 8: Historic site potential/ percentage of high potential area.

The compiled results of cemeteries within the I-69 alternative study bands are given in Table 6 and graphically represented in Figure 9. Once again the results arrived at in the evaluation of Alternative 1 are somewhat misleading in that the total area evaluated in this study band is considerably smaller than all of the others being compared.

Table 6. Recorded Cemeteries within the I-69 two-mile wide study bands.

Criteria	Alternatives											
	1	2A	2B	2C	3A	3B	3C	4A	4B	4C	5A	5B
Study Band	1	2A	2B	2C	3A	3B	3C	4A	4B	4C	5A	5B
Cemeteries	72	102	138	172	144	186	192	101	137	171	154	196

Of the full-length alternatives, 2A and 4A have the least number of cemeteries. Study bands 3B, 3C and 5B include the greatest number of recorded cemetery sites; although, these statistics are attributable to the large number of cemeteries found in and around the Bloomington area of Monroe County.

It should be noted here that many of these family plots and early cemeteries are small in size, do not constitute much area and may therefore be avoided by modification of the 400-foot wide working alignments within respective study bands. This level of cemetery site location research has been designed to shed light on as many of the more obscure and less well-known cemeteries within all alternative study bands as is possible, so that further, more precise location information may be obtained by field reconnaissance during Tier 2 of this study.

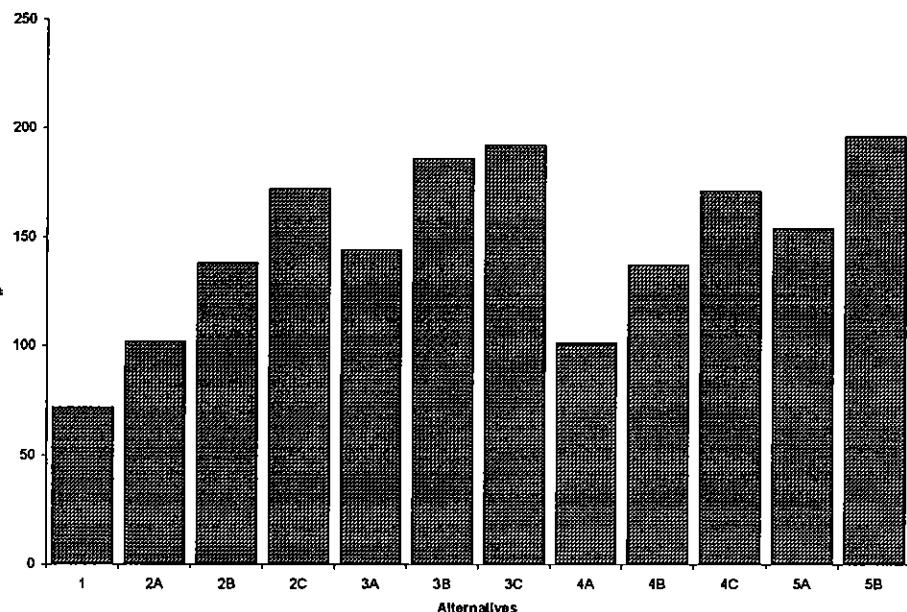

Figure 9: Graphic of cemeteries within I-69 study bands.

## CONCLUSIONS

The archaeological records check completed for this project documented over 14,852 previously recorded archaeological sites within the southwestern Indiana study area. Of these previously recorded archaeological sites, 1924 were found to be located within the project's five, 2-mile wide study bands, 427 were found to be located within the five 2000-foot wide corridors , and only 139 were found to be within the proposed working alignment of the alternatives under consideration. In addition, 56 previously recorded archaeological sites were also found to be located within 150' of either side of existing I-70. The Pyramid Mound (12-K-14) was the only archaeological site located within the five, 2-mile wide study bands of this study that was found to be listed on the National Register of Historic Places.

The creation and utilization of a GIS archaeological database and a GIS-based archaeological analysis for the southwestern Indiana I-69 Tier 1 EIS alternative selection process have been completed. The computerization of the archaeological site locational data and creation of the modeling toolkit of ArcView software, and GIS data sets such as DEM maps, DRG maps has been a daunting task with immeasurable rewards. The computer tools developed through this study have exponentially enhanced the way large area archaeological review and analysis can be accomplished in southwestern Indiana, and provides a blueprint for expansion of these GIS methodologies statewide.

Although records gathering can never be compete, as more information is being developed daily, the results of the archaeological records check combined with the GIS-based archaeological analysis of the study's alternatives should provide a good basis for consideration of archaeological concerns in the selection of a preferred I-69 alternative for the Tier 1 EIS.

This study was conducted per guidelines in "The Management of Archaeological Resources, The Airlie House Report" (McGimsey and Davis 1977), and the Indiana Department of Natural Resources, Division of Historic Preservation and Archaeology's "Guidebook: Indiana Historic Sites and Structures Inventory - Archaeological Sites (1989 edition)". The study is in compliance with recent amendments to the Indiana Historic Preservation Act (IC 14-21-1). The archaeological records check, GIS-based archaeological analysis, and the report and recommendations have been accomplished or directly supervised by a Professional Archaeologist meeting the standards set forth by the U.S. Department of the Interior detailed in 36 CFR Part 61, and 66, and the Secretary of Interior's "Standards and Guidelines for Historic Preservation and Archaeology" (48 FR 44716).
